Was 'The Pox' Virus Embedded Into The Covid-19 Shots To Weaken Public Immunity & Prime Us For This Mpox 'Outbreak'?

Globally-acclaimed medical researcher Karen Kingston has spent the last five years immersed in researching both Covid and monkeypox to expose the shocking agenda behind these insidious assaults on humanity.

Much of the Covid story has now been revealed, especially through peer-reviewed white papers published within the last six months (not that the mainstream media has shared any of those findings with their closeted readers, of course).

However, since the monkeypox flare-up back in 2022 we haven't heard much more, and for most people it seems to have faded away completely. That was until ten days ago when the

WHO suddenly declared it to be a 'public health emergency of international concern.'

Our first question was whether there was some substance to this declaration or if, as we suspected based on our Covid experience, it was another fabricated (or laboratory enhanced) hype to lock everyone down again and force yet another experimental vaccine upon humanity.

While it will take a while for clear evidence to be found and revealed, all the signs at this stage are indicating that this next pandemic is the latter. And Karin has found a startling link between the Covid vaccines and monkeypox. What a surprise!!!

According to a substack post published on August 19, Karen stated that, "While the NIH

spent over \$288 million to embed a latent mRNA "poxvirus" into SARS-2 "vaccines" to weaken the immune system, in 2021, the NTI (which stands for the Nuclear Threat Initiative) ran a tabletop predicting 271 million deaths from monkeypox." She goes on to say that, "What was alarming was the prediction of 271 million deaths due to "monkeypox" and a global "no regrets" approach to managing 'outbreaks'." And is the WHO's declaration on mpox the first of these anticipated 'outbreaks'?

Back in May 2022 Karen gave a couple of interviews on the shocking implications of both the mRNA "poxvirus" that have been embedded into the Covid shots and boosters, and the tabletop exercise that predicted that there would be more than 270 million people dying from monkeypox within the next two years.

Now, I am personally not sure we will ever be able to rack-up 270 million deaths (or even 27 million deaths for that matter) from what is essentially an STD (sexually transmitted disease) even if the public have seriously weakened immune systems. My reasoning is that avoidance of STDs is relatively easy and well-known. So, why all this effort to encode monkeypox mRNA into the jabs, and what is the real agenda behind this, because we can be sure it wasn't just a random 'mistake'?

Karen outlines her thoughts on this in the following two interviews:

- 1) The May 24, 2022 interview with Maria Zee can be watched here: <https://zeeemedia.com/interview/karen-kingston-monkeypox-vaids-who-global-enslavement-future-lockdowns/>. In this interview Karen does a deep dive into the Nuclear Threat Initiative (NTI) and the November 2021 Monkeypox Tabletop exercise.
- 2) Then in the May 25, 2022 interview with Stew Peters which you can watch here: <https://rumble.com/v163j0l-monkeypox-the-cover-up-for-vaids-citizen-researchers-expose-government-plot.html> Karen discusses how monkeypox is a cover up for VAIDS (Vaccine-Acquired Immunodeficiency Syndrome.)

The key points from these two interviews include:

- U.S. and Canadian researchers filed a patent in China filed for encoding "monkeypox mRNA" as a latent virus into the SARS-CoV-2 mRNA found in Pfizer's

and Moderna's COVID-19 mRNA injections.

- Mpox is various forms of herpetic lesions such as shingles, herpes, and even the herpetic cancer Kaposi Sarcoma, as a result of the latent mRNA viruses embedded in the shots and VAIDS (vaccine associated auto-immune disease syndrome).
- The NTI (Nuclear Threat Initiative) projected that 271 million people will die from monkeypox over a period of less than 2 years.
- Per NIH research, monkeypox is a form of VAIDS (a vaccine-associated autoimmune disease) and is meant to evade and weaken the immune system.
- Since 1999, the NIH has spent over \$288 million creating monkeypox and other immune-suppressing pox-like 'vaccines' and 'viruses'.

While we would caution against anyone succumbing to panic and fear over this, neither of which help, it is still worth thinking about how Karen's findings could have a bearing on the pox situation that is currently gaining momentum around us.
